

Sustainability for the retail sector

Getting climate protection rolling with the Salsa

Sustainable corporate action has distinguished us as a regionally based, medium-sized company from the very beginning. Sustainability is therefore a matter of course for the Salsa: minimised use of energy, water and raw materials as well as effective waste avoidance are at the heart of our production processes.

Commitment that can be seen on the sales floor

Salsa meets consumers' desire for transparency and sustainable responsibility

CO2 savings, climate protection

Salsa protects the environment and climate in three ways: through materials, production processes and full recyclability

Resource reduction, waste avoidance

The Salsa is produced in a closed production cycle and makes many contributions to environmental and climate protection for the retail sector

Salsa – sustainability that speaks for itself

What is special about the materials used for the Salsa?

The Salsa puts sustainable quality directly on the sales floor.

What about the CO2 balance?

The Salsa actively protects the climate with 35% less CO2 used in the production process.

What resources are used?

The Salsa saves resources thanks to a closed production cycle.

The Salsa shopping trolley is made of polypropylene. On request, the version made of recycled materials can also be ordered. This material is food-grade and does not leach **any harmful substances**. It is robust and extends the Salsa's product lifecycle to at least 10 years – and that's a good thing: because **using it for longer means less production**. Provision is also made for its end-of-life: the material can be **fully recycled**. Globally, the **proportion of plastics that can be recycled** is the highest for polypropylene.

The material used is not only robust, **but also extremely light**. This allows the energy consumed during production to be significantly reduced – and that **saves CO2**: more than one third* compared to conventional shopping trolleys. Of course, this also applies to its **transport: a lightweight shopping trolley simply rolls better**.

* Shopping trolley comparison based on CO2 emissions per kg material for the Wanzl EL155 vs. the Wanzl Salsa 150

The material used for the Salsa is **fully recyclable**. Salsa is not only designed with organic materials, it is also intelligently engineered and **is easily disassembled** making it a cinch to recycle. **And residues? There are none**. Production waste is **fully processed** and **returned to the production process**.

Find out all about the advantages of the Salsa now.
